

All Ceramic Crowns

This individual has severely worn his front four teeth. A bite problem has developed and the teeth appear unesthetic. Crowns are required to properly restore the teeth and correct the bite deficiency. All ceramic crowns were chosen due to their highly esthetic and natural appearance.

The all ceramic crowns were fabricated in a dental laboratory using a model of the prepared teeth. All ceramic crowns have an inner dense tooth-colored core, over which porcelain is bonded. The porcelain has excellent light transmitting properties, giving these restorations their natural appearance.

The all ceramic crowns are adjusted and fitted over the prepared teeth. The shape and color are chosen to match the existing natural teeth. The crowns are bonded to the teeth and usually provide an excellent, esthetic result.
